

### Removing blanks from the TXR

Although it is relatively simple to remove blanks from the TXR by hand, if there are many items on a sheet it may be more productive to use one of our proprietary removal solutions.

The Hand-operated Lifter and the Automatic Unloader are available for both sizes of machines, and can be tailored to suit your production requirements.

### Hand-operated Lifter

The Hand-operated Lifter is a battery-powered stand-alone accessory with which the operator can quickly remove multiple products from the TXR pin-bed. The Lifter offers an economic and flexible option to increase productivity especially where there are many blanks on a sheet.

### Automatic Unloader

The Automatic Unloader works in conjunction with the TXR, under operator control, to unload blanks from the pin-bed and transport the product to a conveyor where it can be swiftly banded and/or packed ready for despatch. The machine employs an array of steel knives which pass through the pin-bed after each stripping cycle.
